

Sendmail + LDAP How-to

1. Installation des programmes

Sous debian :

```
#apt-get install slapd  
#apt-get install sendmail
```

Additionnellement on pourra rajouter des programmes à l'ihm confortable :

```
#apt-get install directory-administrator (gtk)  
#apt-get install ldapexplorer (web)
```

ou

<http://www-unix.mcs.anl.gov/~gawor/ldap/> (applet java)

2. Configuration

2.1 LDAP

Il suffit de se laisser guider par les scripts de post-configuration debian.

A titre informatif, on trouvera en annexe 1 notre fichier de configuration slapd.conf

Pour remplir notre annuaire qui est maintenant vide, on utilisera les scripts de configuration trouvés sur www.padl.com.

2.2 Sendmail

De même, les scripts de post-configuration debian nous guide au travers de la configuration de sendmail.

Pour spécifier que l'on veut utiliser ldap, on rajoute au fichier .mc (qui nous aidera à générer plus tard le fichier .cf de configuration de sendmail) :

```
# a rajouter avant MAILER_DEFINITION  
define('confLDAP_DEFAULT_SPEC','-h pc3c07.u-strasbg.fr -b  
dc=pc3c07,dc=u-strasbg,dc=fr')
```

```
FEATURE(ldap_routing)  
LDAPROUTE_DOMAIN(pc3c07.u-strasbg.fr)  
#fin rajout
```

-h pour l'hôte à contacter

-b pour la base de la recherche ldap

En annexe 2, on trouvera le fichier sendmail.mc utilisé chez nous.

Conformément au Draft IETF intitulé "LDAP Schema for Intranet Mail Routing", sendmail

va à présent rechercher les variables :

mailLocalAddress, mailRoutingAddress et mailHost.

Par exemple :

```
dn: uid=tom, o=example.com, c=US
objectClass: inetLocalMailRecipient
mailLocalAddress: tom@example.com
mailRoutingAddress: thomas@mailhost.example.com
```

Va délivrer un message pour tom@example.com à thomas@mailhost.example.com.

```
dn: uid=dick, o=example.com, c=US
objectClass: inetLocalMailRecipient
mailLocalAddress: dick@example.com
mailHost: eng.example.com
```

Va relayer les mails pour dick@example.com à la même adresse mais rediriger vers les enregistrements MX pour l'hôte eng.example.com.

Pour que Sendmail recherche les alias dans l'annuaire, on rajoute au fichier .mc :

```
define('ALIAS_FILE', 'ldap:-k (&(objectClass=nisMailAlias)(cn=%0)) -v
"rfc822MailMember"')
```

Pour de plus amples informations ou problèmes, on se réferrera à l'url suivante :

<http://www.linuxdoc.org/HOWTO/LDAP-Implementation-HOWTO/sendmail.html>

Annexe 1 : slapd.conf

```
# This is the main ldap configuration file. See slapd.conf(5) for more info on the
# configuration options.

# Schema and objectClass definitions
include      /etc/ldap/schema/core.schema
include      /etc/ldap/schema/cosine.schema
include      /etc/ldap/schema/nis.schema
include      /etc/ldap/schema/inetorgperson.schema
include      /etc/ldap/schema/misc.schema
include
/usr/share/doc/directory-administrator/examples/trustMode.schemaOpenLDAP2
include      /etc/ldap/schema/openldap.schema

# Schema check allows for forcing entries to
# match schemas for their objectClasses's
schemacheck    off

# Where the pid file is put. The init.d script
# will not stop the server if you change this.
pidfile      /var/run/slapd.pid

# List of arguments that were passed to the server
argsfile     /var/run/slapd.args

# Where to store the replica logs
replogfile      /var/lib/ldap/replog

# Read slapd.conf(5) for possible values
loglevel      9

# The backend type, ldbm, is the default standard
database      ldbm

# The base of your directory
suffix       "dc=pc3c07,dc=u-strasbg,dc=fr"

# Where the database file are physically stored
directory     "/var/lib/ldap"

# Indexing options
index objectClass eq

# Save the time that the entry gets modified
lastmod on

# The userPassword by default can be changed
# by the entry owning it if they are authenticated.
# Others should not be able to see it, except the
# admin entry below
access to attribute=userPassword
        by dn="cn=admin,dc=pc3c07,dc=u-strasbg,dc=fr" write
        by anonymous auth
        by self write
        by * none

# The admin dn has full write access
access to *
        by dn="cn=admin,dc=pc3c07,dc=u-strasbg,dc=fr" write
        by * read

# For Netscape Roaming support, each user gets a roaming
# profile for which they have write access to
access to dn=".*,ou=Roaming,o=morsnet"
        by dn="cn=admin,dc=pc3c07,dc=u-strasbg,dc=fr" write
        by dnattr=owner write

rootdn "cn=admin,dc=pc3c07,dc=u-strasbg,dc=fr"
rootpw secret
```

Annexe 2 : sendmail.mc

#
# Generated automatically from sendmail.mc.in by configure.
#
# sendmail.mc prototype config file for building Sendmail 8.12.1
#.
#
# This file is used to configure Sendmail for use with Debian systems.
#
# If you modify this file, you will have to regenerate /etc/mail/sendmail.cf
# by running this file through the m4 preprocessor via one of the following:
#      * `sendmailconfig'
#      * `make'
#      * `m4 /etc/mail/sendmail.mc > /etc/mail/sendmail.cf'
# The first two options are preferred as they will also update other files
# that depend upon the contents of this file.
#
# The best documentation for this .mc file is:
# /usr/share/doc/sendmail-doc/cf README.gz
#
